Business Brief: Sales Trends and Customer Value

Prepared for: Head of E-commerce | **Period:** Jan-Dec 2025 | **Data:** simulated (5,000 orders, 400 customers, INR). No real customer data used.

Context

We wanted to know which months and categories earn the most, who our best customers are, and which customers are going quiet. Total revenue in the period was **INR 2.98 million**, with an average order value of **INR 595**.

Key findings

- **Revenue climbs through the year and peaks in the festive quarter.** November is the best month (INR 323k), about **1.7x** the weakest month, February (INR 187k). Q4 brings **30.9%** of annual revenue versus 20.6% in Q1. December falls 10.1% from November.
- **Electronics earns almost half the revenue.** Electronics is **45.7%** of revenue from 30% of orders, because each order is worth about INR 912. Fashion has the most orders (1,751) but only 26.6% of revenue. Books is the smallest at 6.0%.
- **Revenue is concentrated, but not exactly 80/20.** The top 10% of customers (40 people) bring **36.2%** of revenue and place about 45 orders each. The top 20% bring 51.5%. Reaching 80% of revenue takes half the customer base (202 customers).
- **Few customers have gone quiet.** 35 customers (**8.8%**) have not ordered in over 90 days. 33 of them are in the bottom half by spend, and none are in the top 10%. Together they account for about INR 96k of past spend (3.2% of revenue).

Recommendations

1. **Reward the top 10% with a loyalty programme.** These 40 customers bring INR 1.08M (36.2% of revenue) and none is at churn risk today, so the goal is to keep them. Offer early access to festive sales and track their order frequency monthly.
2. **Run a win-back offer for the 35 customers inactive for 90+ days.** Their past spend is about INR 96k, and 94% of them are low spenders, so use a low-cost email or coupon rather than expensive discounts. Measure success as the share who order again within 30 days.
3. **Plan stock and campaigns around October to December, led by Electronics.** Q4 is the strongest quarter and Electronics the biggest category, so secure Electronics inventory and ad budget before October, and plan a December follow-up to soften the 10% drop after November.

Next steps

- Look at the middle 40% of customers, who bring the largest block of revenue (43.5%), for upsell opportunities.
- Replace the simulated data with real order history and re-run the notebook to confirm these patterns.
- Track category mix by month to see whether Electronics is the driver of the Q4 peak.

Assumption: the dataset is simulated with a built-in festive-season lift, so the Q4 pattern reflects that design. The method carries over to real data; the numbers do not.
